
LOGIN

1. Node connects to supernode.
2. Node and supernode detect NAT/Firewall.
3. Node connects to login server.
4. Login server authenticates the user.
5. After the node has successfully logged in, the login server returns user's contact list.
6. Depending on the network capacity the node could become a supernode.

CALL

7. Supernode provides information about connected users.
8. Node searches local network first, then contacts the nearest supernode.
9. Encrypted communication among nodes.
